THIS ARTICLE WILL HELP YOU:

- **Find an experiment ID**, campaign ID, audience ID, variation ID, or event ID
- Identify an audience, campaign, or page by its ID **when descriptive names are masked**
- **Troubleshoot** using the JavaScript API, console log, or network panel

Sometimes, it's useful to know an experiment or campaign ID for troubleshooting.

For example, [masking descriptive names](#) prevents you (or anyone else) from seeing the name of a variation or campaign in the console. Instead, the JavaScript API, console log, and network panel return a masked identifier: a string of numbers. This is great for privacy, but challenging for troubleshooting.

Use the API Names panel to find:

- Experiment or campaign IDs
- Variation IDs
- Audience IDs
- Page IDs
- Event IDs

Navigate to your experiment or campaign and select the **API Names** tab to view the campaign or experiment ID, variation IDs, audience IDs, and more.
